

In this example, we will get the sum of **Last Occurrences** where the **Proposition** is "Level 2" and its children, and the **Activity Type** is "AT 1".

First, we need to make a supporting rule that gets us the **Proposition Path** of the **Proposition** "Level 2". The **Proposition Name** in the **Proposition Data Adapter** is actually the full **Proposition Path** and so this field will be retrieved:

Proposition - Proposition Name - Level 2

Enter a brief description of your Eligibility Rule

Proposition name of Level 2 ...

This **Proposition Path** will match the **Proposition** "Level 2" and its children. In order to make our rules consistant between when we want to include or exclude the parent, we will wrap this rule is a new rule:

Proposition - Proposition Name - Level 2 - Inclusive

Enter a brief description of your Eligibility Rule

Proposition - Proposition Name - Level 2	...
--	-----

As we are aggregating, we first need to select which aggregation **function** we are using. We will be using **Latest date in** to get the latest date from the **Last Occurrence** for each matching **Proposition** & **Activity Type**:

Proposition - Last Occurrence - Level 2 Inclusive + AT 1

Enter a brief description of your Eligibility Rule

latest date in	<div></div>	...
----------------	-------------	-----

Next, we open the **DIP**, select the field we want:

Done

You will notice that as we have used this **function**, when we enter the **DIP** we are limited to only fields that return a **Datetime** and that we are not required to apply any filters.

We will select the rule we made for the **Proposition**, and apply our **Activity Type** filter:
