

In this example, we will get the **Activity Count** where the **Proposition** is the Proposition we have assigned to the **Action** that **MX0** is evaluating the **Eligibility** for, and the **Activity Type** contains the text "Checkout -".

As we are aggregating, we first need to select which aggregation **function** we are using. We will be using **Sum of the elements in** to get the total number of **Activity Count** for each matching **Proposition** & **Activity Type**:

Proposition - Activity Count - Current Proposition + Includes 'Checkout -'

Enter a brief description of your Eligibility Rule

sum of the elements in ...

Next, we open the **DIP**, select the field we want:

Choose a data item as a list

Done ✓

You will notice that as we have used this **function**, when we enter the **DIP** we are limited to only fields that return a **number** and that we are not required to apply any filters.

Next, we will apply our **Proposition** filter, we do this by using the option **Current proposition**, and apply our **Activity Type** filter:

Choose a data item as a list

Activity count

Propositions / Activities / Activity count

Retrieve the Activity count for Propositions where

Proposition name = Current proposition

Retrieve the Activity count for Activities where

Activity Type name ≥ Checkout -

Cancel

Next

Finally, we save our rule:

Proposition - Activity Count - Current Proposition + Includes 'Checkout -'

Enter a brief description of your Eligibility Rule

sum of the elements in

[ Activity count of Current Proposition + ... 'Checkout -' ]

...
